Circular Dependency

Date
Page 19

Solution Setter injection:

→ Spring IOC container:

1. Create OrderService empty obj.
2. Create PaymentService empty obj
3. Inject PaymentService to OrderService
4. Inject orderService to paymentSer

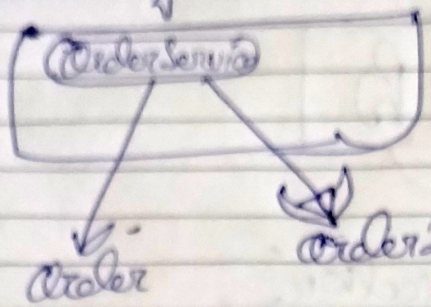

→ But in Spring Boot

↳ → Circular Dependency option is by default off.

↳ → So instead of managing the dependency we should improve code

Bean Scopes

Bean Scopes:

1. Singleton.
2. Prototype. → different objects will be passed.

→ in both A and B both same orderService obj will be pass

Singleton → Eager initialization

Prototype → Lazy initialization

Other Scopes:

- Request
- Session
- Application

Singleton : stateless

Prototype : Stateful.

Date
Page 21

Beans Initialization

- Eager
- Lazy.

By default

- Singleton → Eager, Lazy (@Lazy)
- Prototype → Always @Lazy (cannot be changed)
