Spring IOC Container | Beans, @Component, @Autowired, @Bean.

Date
Page 16

IOC Container → Beans (In IOC container we tell objects beans)

→ 2 way spring will handle Beans:
1. Annotation based
2. XML Configuration based.

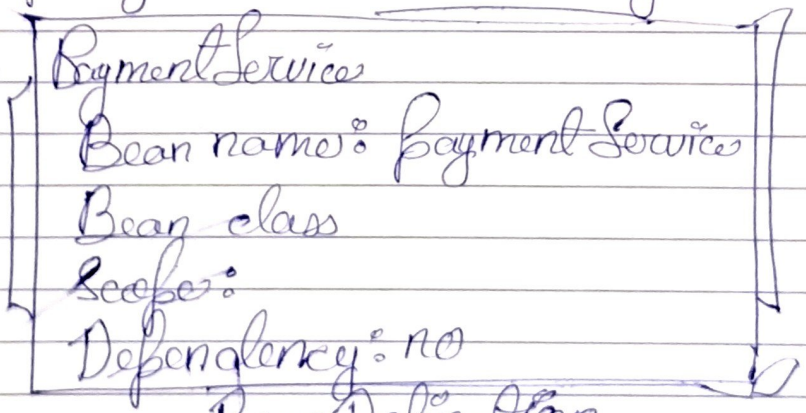

→ Types of dependency Injection:
1. Constructor Injection
2. Setter Injection
3. Field Injection (Not Possible Normal) → (But possible in Spring)

→ Why Constructor Injection is Recommended?

- Dependency get wired at the time of object creation.
- final variable can be used
- Easy to test the class. (Unit testing)

→ Steps for ApplicationContext (IOC container):

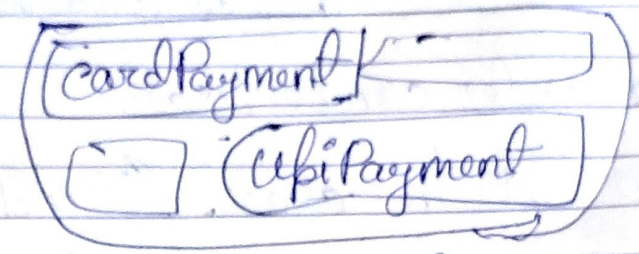

step 1: Spring start the container
step 2: Spring reads AppConfig.java
step 3: Spring processes @Component bean.
step 4: Spring finds @Component classes.
step 5: Spring creates Bean definations.

Bean Definations.

step 6: Spring starts creating objects
step 7: Your application uses this Beans.

→ When there is multiple services (we need to specify which service to inject)

OrderService order = new OrderService(which to choose)

Two way

@ Primary
@ Qualifier.
